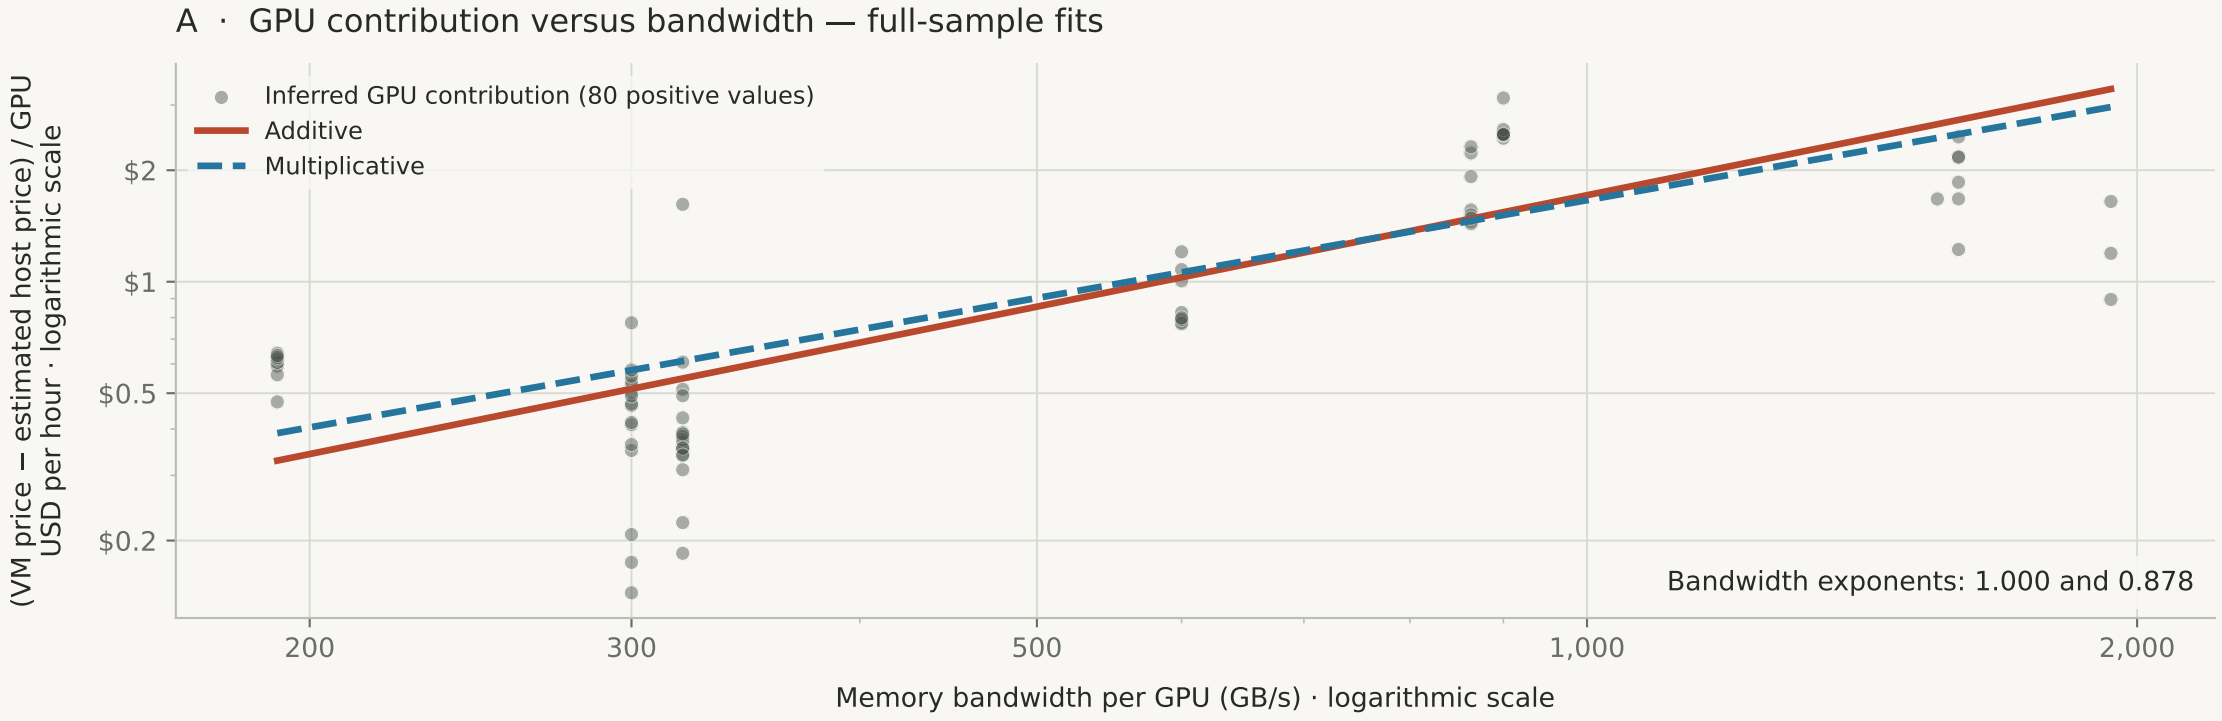
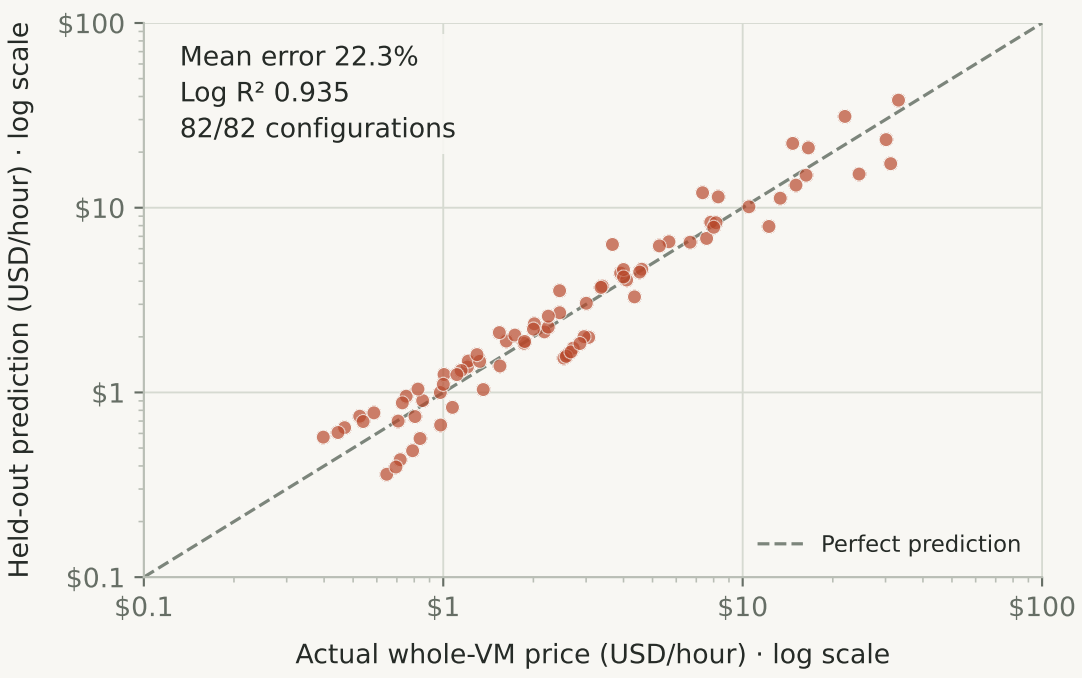
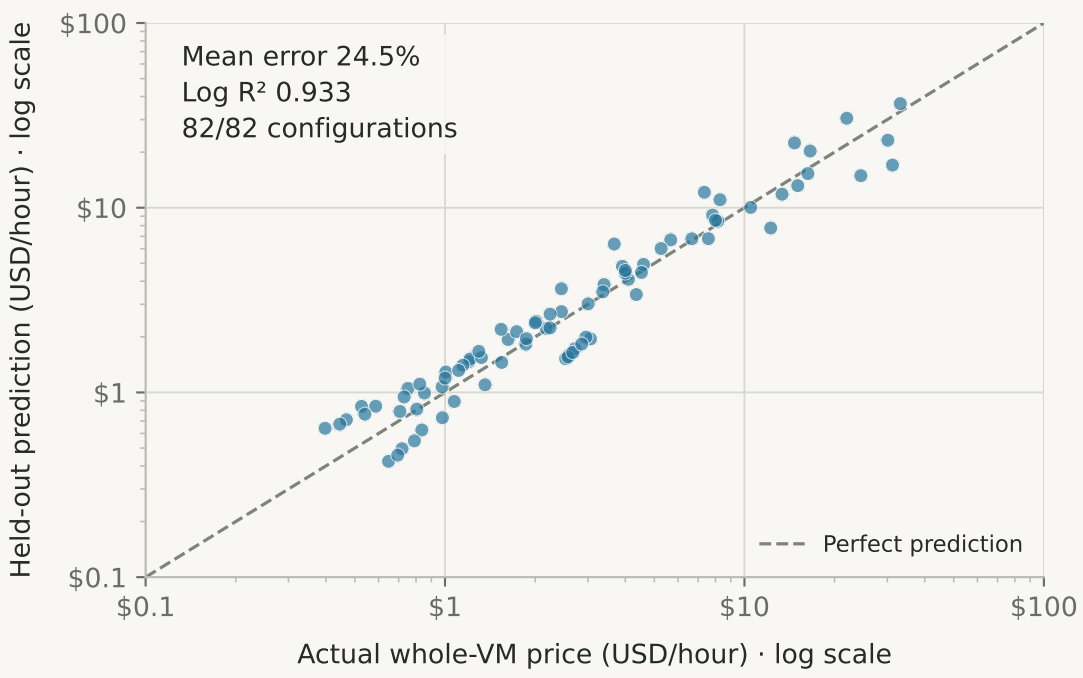
Different formulas, similar fitted curves

82 cloud configurations · 12 machine families · 8 GPU models · Prices 2026-09-29 UTC







Top: subtracts an estimated host baseline; points are not separately billed GPU prices. 2 nonpositive residuals cannot appear on a log axis.
Bottom: all 82 VM prices remain included. Each prediction refits both stages without the test machine family. Both panels share identical axes.
FP32 and VRAM terms fitted to zero in both full-sample models; the top curves therefore depend only on bandwidth.
